

Cable Management System

Metal Raceway Product Range

Cable Ladder

In the electrical wiring of buildings ,Any Industrial or Commercial Units a cable tray system is used to support insulated electric cables used for power distribution and communication. Cable trays are used as an alternative to open wiring or electrical conduit systems, and are commonly used for cable management in commercial and industrial construction. They are especially useful in situations where changes to a wiring system are anticipated, since new cables can be installed by laying them in the tray, instead of pulling them through a pipe.

Several types of tray are used in different applications. A solid-bottom tray provides the maximum protection to cables, but requires cutting the tray or using fittings to enter or exit cables. A deep, solid enclosure for cables is called a cable channel or cable trough.

A ventilated tray has openings in the bottom of the tray, allowing some air circulation around the cables, water drainage, and allowing some dust to fall through the tray. Small cables may exit the tray through the ventilation openings, which may be either slots or holes punched in the bottom. A ladder tray has the cables supported by a traverse bar, similarly to the rungs of a ladder, at regular intervals on the order of 4 to 12 inches (100 to 300 mm).

Ladder and ventilated trays may have solid covers to protect cables from falling objects, dust, and water. Tray covers for use outdoors or in dusty locations may have a peaked shape to shed debris including dust, ice or snow. Lighter cable trays are more appropriate in situations where a great number of small cables are used, such as for telephone or computer network cables. These trays may be made of wire mesh, called "cable basket", or be designed in the form of a single central spine (rail) with ribs to support the cable on either side.

Large power cables laid in the tray may require support blocks to maintain spacing between conductors, to prevent overheating of the wires. Smaller cables may be laid unsecured in horizontal trays, or secured with cable ties to the bottom of vertically mounted trays.

To maintain support of cables at changes of elevation or direction of a tray, a large number of specialized cable tray fittings are made compatible with each style and manufacturer. Horizontal elbows change direction of a tray in the same plane as the bottom of the tray and are made in 30, 45 and 90 degree forms; inside and outside elbows are for changes perpendicular to the tray bottom. These can be in various shapes including tees and crosses. Some manufacturers and types provide adjustable elbows, useful for field-fitting a tray around obstacles or around irregular shapes.

Various clamping, supporting and splicing accessories are used with the cable tray to provide a complete functional tray system. For example, different sizes of cable tray used within one run can be connected with reducers.

Common cable trays are made of galvanized steel, stainless steel , aluminum, or glass-fiber reinforced plastic. The material for a given application is chosen based on where it will be used. Galvanized tray may be made of pre-galvanized steel sheet fabricated into tray, or may be hot-dip galvanized after fabrication. When galvanized tray is cut to length in the field, usually the cut surface will be painted with a zinc-rich compound to protect the metal from corrosion.

Ventilated Type Ladders:

(Standards, Load Capacity, Support Location and Electrical Grounding)

KMC Australia manufactures Ventilated type cable Ladders and the support system for the cable Ladders. It produces the full range of products, which includes the custom design accessories for all types of ladders. All this accessories are very easy to erect and install at site, with which it saves the time and generates the profit. The cable ladder management system has been developed to suit the demand of an ever-changing global market.

Ventilated cable ladders have a standard height of Maximum of 100mm. and it is mostly used for the smaller type of cables. The standard height of our ladder is 50mm and the length is 3meter. The maximum length we can offer for our cable ladder is upto 6mtr.

BS Standard:

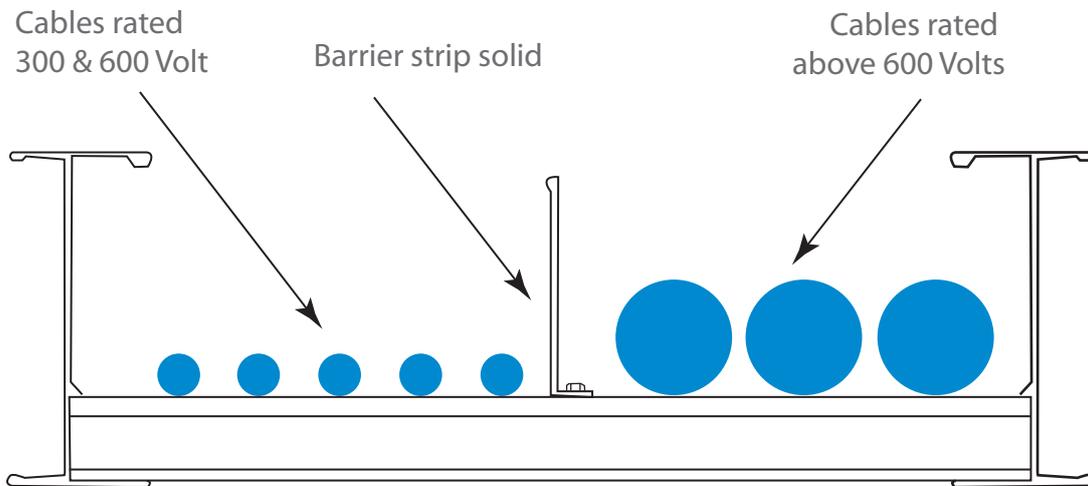

- Cable ladder are manufactured as per **BS EN 61537-2007**
- Manufacturing Steel Complying with **BS EN 10111: 1999**.
- Hot Dipped Galvanized after Fabrication is as per **BS EN ISO 1461 (Formerly BS 729) (HDG) - ASTM A123**
- Pre Galvanized is as per **BS EN 10142 (PG) - ASTM B623 A65386 G133G90**
- Epoxy coated in RAL Colours to **BS 6920(EP)**
- Stainless Steel is as per **BS EN 10088 - 2 : 2001 (SS) - SS34 (SS304 Grade) SS36 (SS304 Grade)**
- GPP is as per **BS 467 - Part 7 Class 1 (GRP/FRP)**
- PVC Coated - PC

NEMA Standard:

- Cable ladder are manufactured as per - NEMA VE 1, NEC 392
- Installation Guide - NEMA VE2
- Hot Dipped Galvanized after Fabrication is as per - ASTM 123
- Load carrying capacity - NEMA VE1-1998
- Allowable cable fill - NEC 392-2002
- Available in PG-Pre Galvanized, ASTM 653A/ASTM A924, HG - Hot Dipped Galvanized
- PC-PVC Coated, EP-Epoxy Coated, SS34,-SS304 grade, ASTM A-240
- SS36-SS316 grade, Al-Aluminium

Ventilated cable ladder is designed to carry both power cable & data communication cable. A barrier strip through the cable ladder can use it. The barrier strip should be made of the same material as the ventilated cable ladder.

Cable Ladders are designed to carry the heavy-duty power cables and as well as the small light duty communication & data cables. It even can carry both the power cable and the data cable in one ladder by using a dividing strip (barrier Strip).

Barrier strips are used to separate cables, such as above 600 volts and below 600 volts are laid (Installed) in the same ladder. The barrier strip should be made of the same material as the cable ladder

Data / Communication Cabling:

Low voltage cables can be stacked as there is no heat generation problems. The BS standard as a calculation of the total cross sectional area of the cables not exceeding 50% of the fill area of the cable ladder. As the cable fill area of the cable ladder system affects the possible loading, both the loading depth and width of the ladder must be considered.

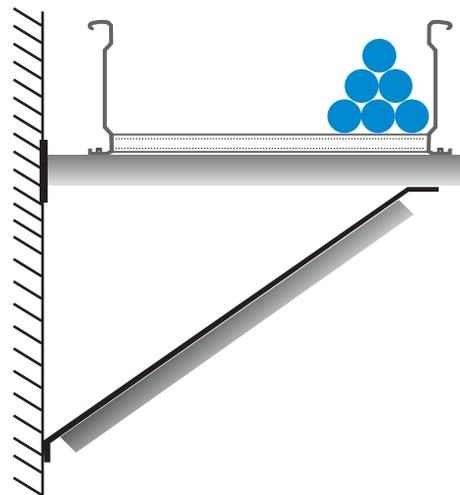

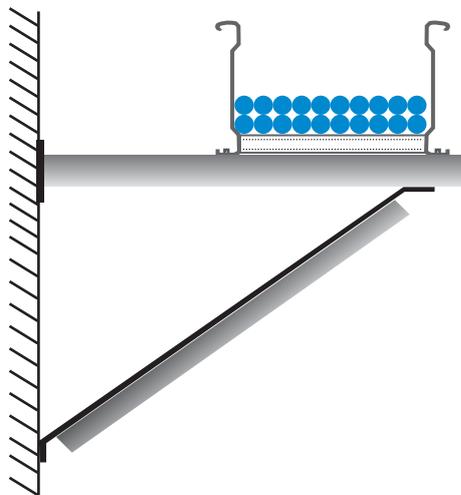

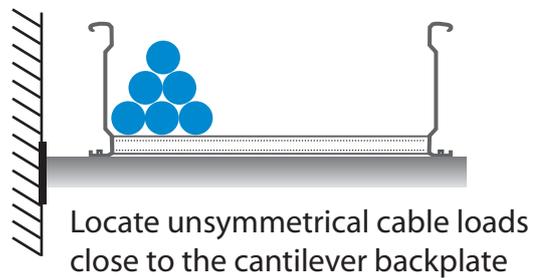

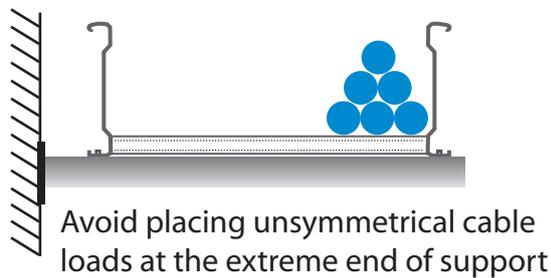

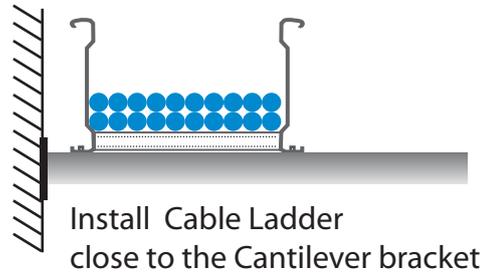

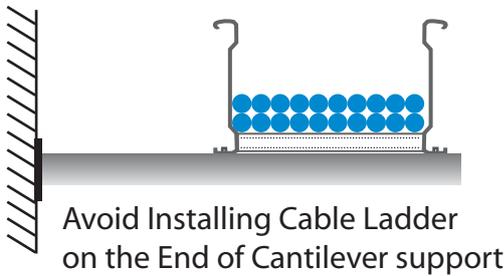

Calculated Cable Weight in Kgs/ Ft

Ladder Size	900mm	750mm	600mm	450mm	300mm	225mm	150mm
6 " Load Depth	37Kg	29Kg	23.5Kg	19Kg	12Kg	9Kg	6Kg
5 " Load Depth	30Kg	24Kg	19.5Kg	15.5Kg	10.5Kg	8Kg	5.5Kg
4 " Load Depth	25Kg	19.5Kg	16Kg	12Kg	8Kg	6Kg	4Kg
3 " Load Depth	19Kg	14.5Kg	12Kg	9.5Kg	6Kg	4.5Kg	3Kg
2 " Load Depth	12.5Kg	9.5Kg	8Kg	6.5Kg	4Kg	3Kg	2.5Kg

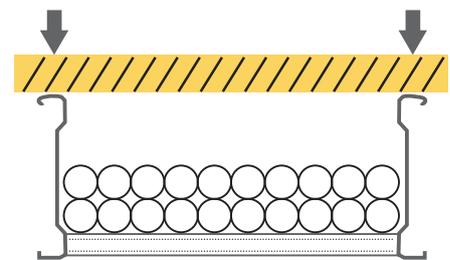

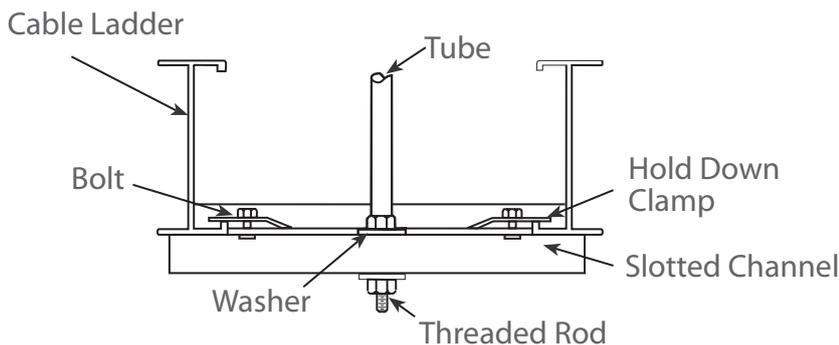

For a calculation example UTP category 5 cable(O.D=0.21,0.0119Kg / Ft) were used.

Calculation Example: Ladder area = 12 In x 3In = 36 Sq.In
 50% Fill in area = 36 Sq.In x 0.5 = 18 Sq.In
 Cable area = (0.21 In)² x 3.14/4 = 0.0346 Sq.In
 Number of cables = 18 Sq.In / 0.0346 Sq.In = 520 cables

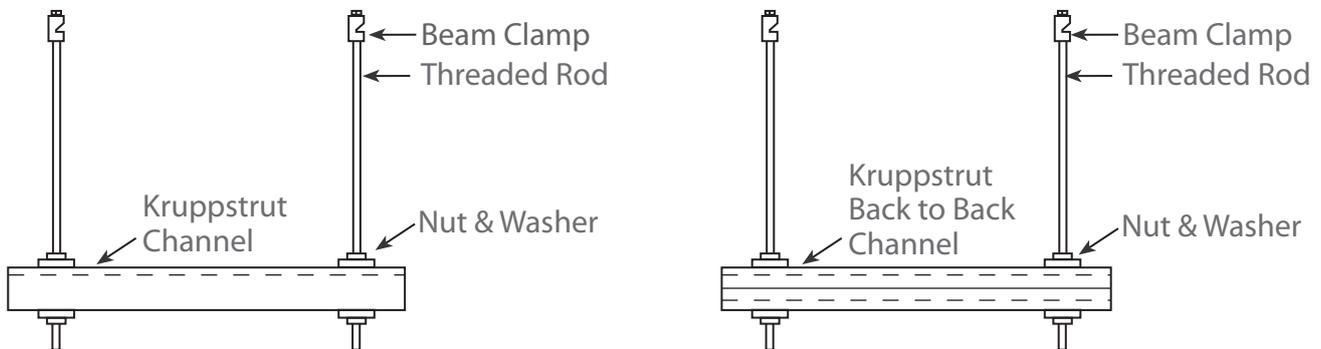

Use the cantilever props for the above type of cable loads.

Single Centre Support for Cable Ladder

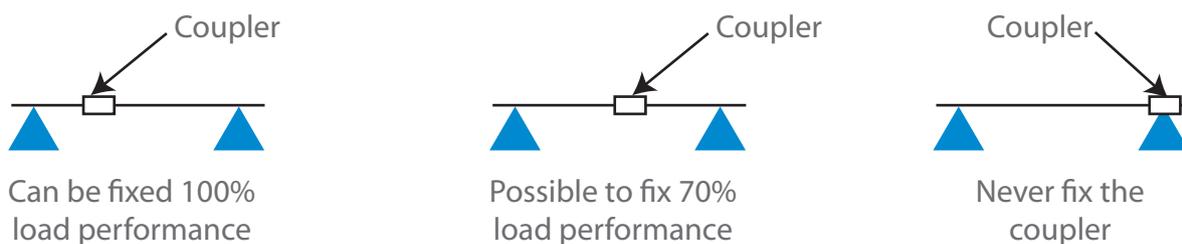

The correct application of load on to the ladder using a board to spread the load evenly on to the side members

Trapeze Hanger Support

To ascertain the correct load as per the loading graph, it has to follow strictly as per our installation standard or as per BS5950 - part V - 1987(All safe loads are calculated as per the BS standard). It also depends how you install the splice plate (joining coupler) on a straight run. Installation has to be done as per below drawing to get the exact load as per standards.

Can be fixed 100% load performance

Possible to fix 70% load performance

Never fix the coupler

(Placing the point of coupler at 1/5th of the span is the best solution for 100% performance)

(The coefficient to be applied on the permissible load if coupler at 2nd position is 0.7)

(Never put the support under the part of coupling)

Sizing Trays for Multiple-Conductor Cables

Section 318-9 lists the requirements for installing multiple-conductor cables in ladder, Ventilated trough (Cable trays), or channel type trays (Trunkings). For ladder or ventilated trough trays, the diameter of all cables 25 Sq mm and larger must be added together and the total must not exceed the width of the cable tray. Cables must be placed side by side. Table 318-9, Column 1 is used for cables less than 25 Sq mm. These cables do not have to be placed side by side. Table 318-9, Column 2 is used for a combination of cables rated larger than 25 Sq mm and smaller than 25 Sq mm. The total cross-sectional areas of the cables in trays with an inside depth of 6" or less, containing control and/or signal cables must not exceed 50% of the cross-sectional area of the tray. Table 318-9, Column 3 is used for cables smaller than 25 Sq mm. Table 318-9, Column 4 is used for a combination of cables rated 25 Sq mm or larger, or less than 25 Sq mm. For ventilated trays with an inside depth of 6 inches or less, containing control and/or signal cables, the total cross-sectional areas of the cables must not exceed 40% of the cross-sectional area of the tray. For channel type trays, the total cross-sectional areas of all cables must not exceed 2.5 square inches for 3-inch wide trays or 3.8 square inches for 6-inch wide trays.

Sizing Trays for Single Conductor Cables

For ladder or ventilated trough trays, the total diameter of all cables 500 Sq mm and larger must not exceed the width of the cable tray. Table 318-10, Column 1 is used for cables smaller than 500 Sq mm. Tables 318-10, Column 2 is used for a combination of cables rated 500 Sq mm and larger, and smaller than 500 Sq mm. For ventilated channel type trays, the total diameter of all cables must not exceed the inside width of 4" or 6" wide trays.

System Grounding

The purpose of system grounding is to drain off any excessively high voltages that may accidentally come on the tray system. If the system is properly grounded by means of a low-resistance conductor of sufficient capacity, the current will be carried off to earth immediately with a minimum danger of fire or shock. In a grounded system, an accidental grounding of one of the current carrying conductors will result in a short circuit, and cause a fuse or circuit breaker to open.

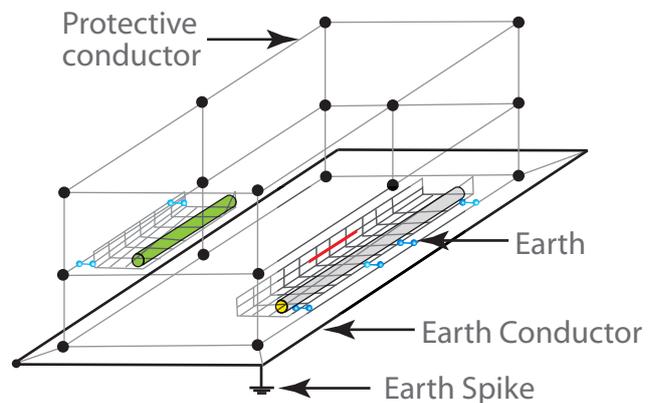

Equipment Grounding

Equipment grounding means the connection to earth of all exposed, non-current carrying metallic parts of the components of the distribution system. The purpose of this ground is to prevent a voltage higher than earth potential on cable tray or equipment. Grounding thus reduces the danger of shock or fire in the event a live conductor comes in contact with these conductive parts.

Methods of Grounding

Effective grounding must be permanent and continuous, and have ample capacity to safely conduct any current likely to be imposed on it. It should also have impedance sufficiently low to limit the potential above ground and to facilitate operation of over-current devices in the circuit. A continuous, underground metallic water supply system is acknowledged to be the best electrical ground.

Other suitable methods of grounding include continuous metallic steam and gas piping systems, the grounded metal framing of the building, or an artificial electrode such as a driven steel pipe, galvanized or otherwise protected from corrosion, or a buried metallic plate. The tray system and equipment ground connections should be made to the same electrode at the service entrance, on the supply side of the equipment used for disconnecting the service. Equipment should be solidly tied in with the system ground. It is also important, that wherever multiple grounds are used, they be tied together in order to avoid any difference of potential between the

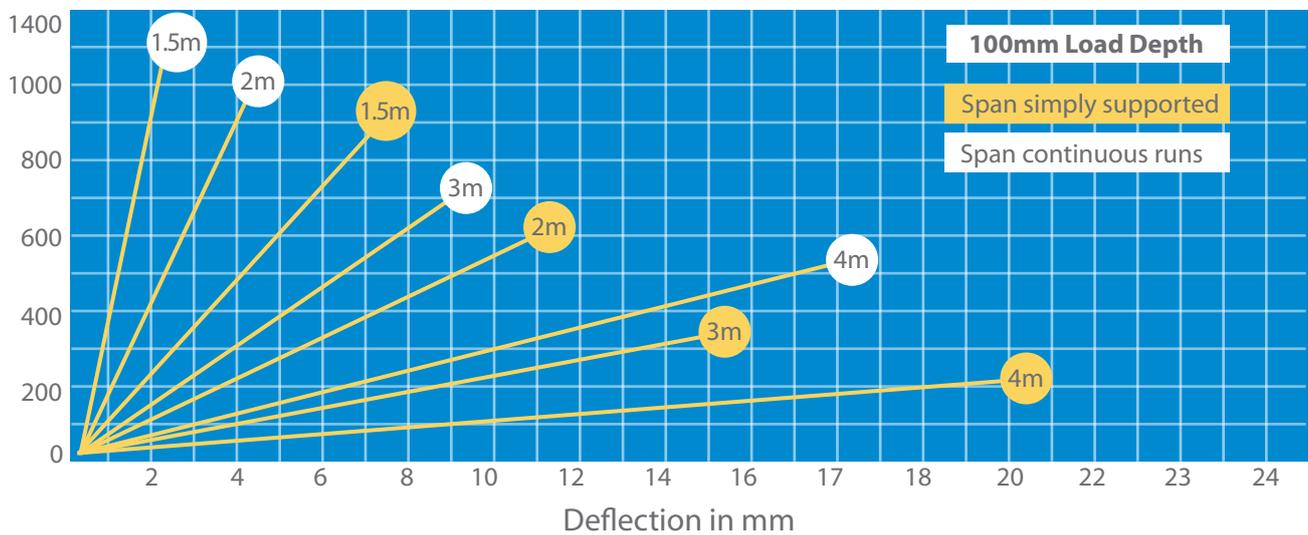

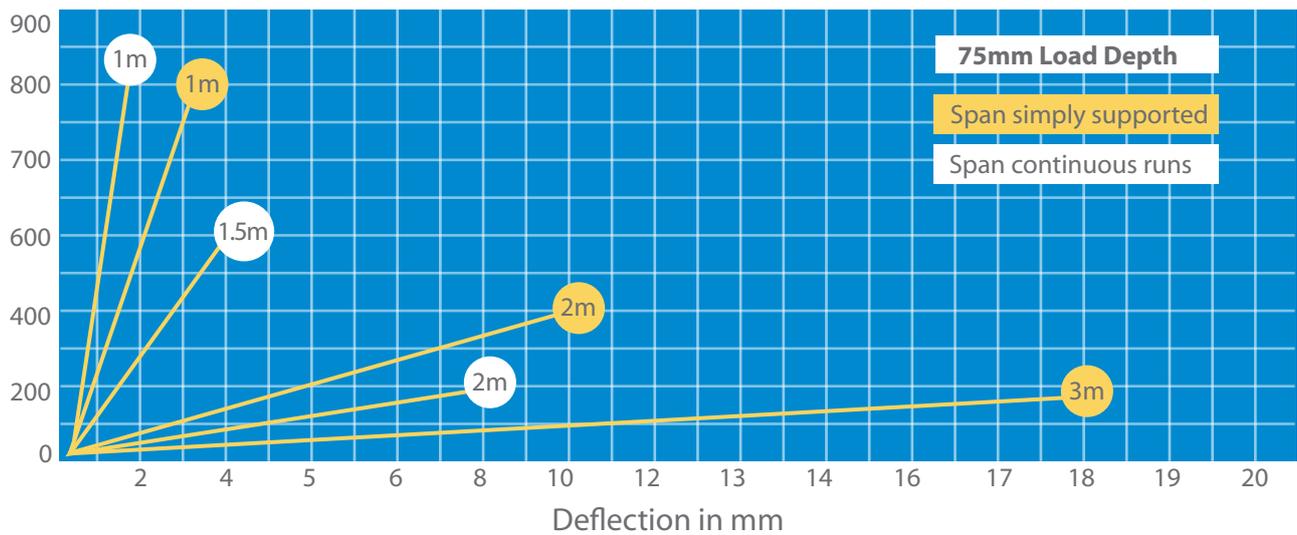

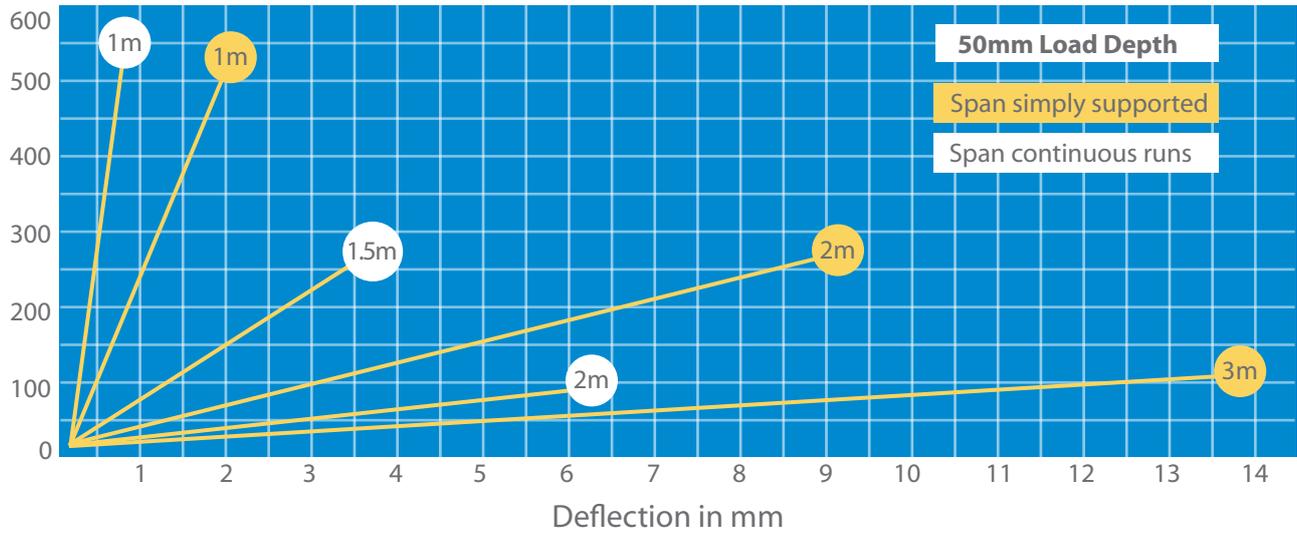

The following page you can find load carrying capacity of each cable ladders with different types of load depth. All the technical details are subject to the standard and as per the specifications any deviation in the specification that may change the load carrying capacity.

Note:

Please add the material code while placing the order for any of our product. For Example 150mm cable ladder with 50mm load depth with Epoxy coating, the code as follows KLC15015EP

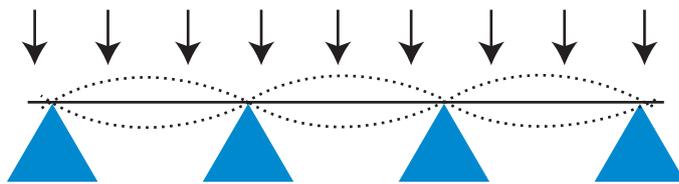

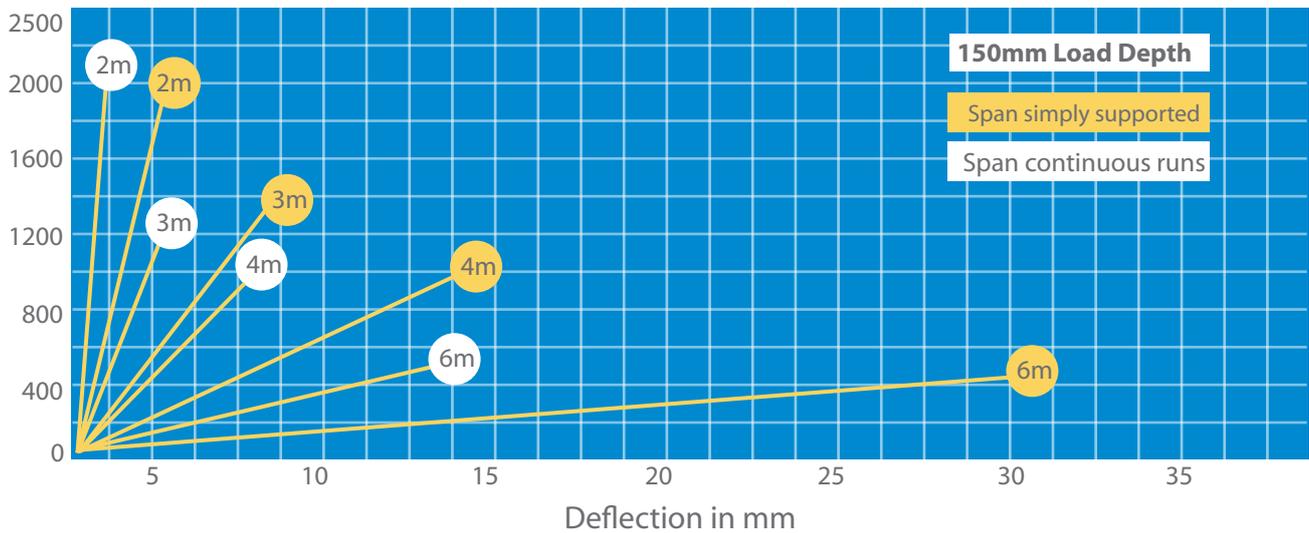

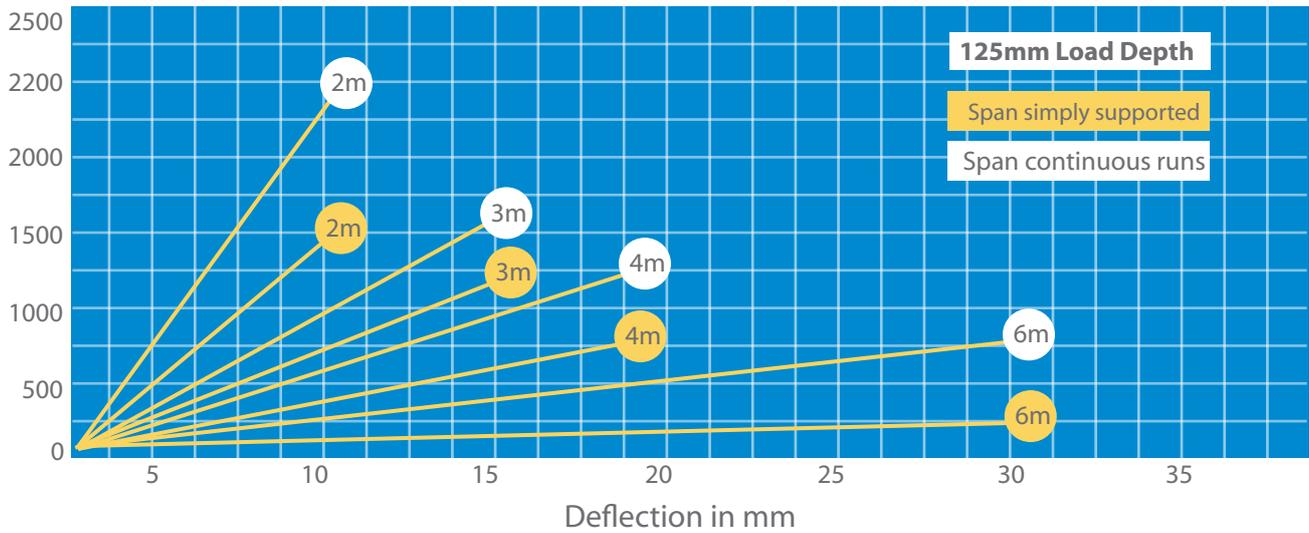

Uniformly Distributed Load in Kgs

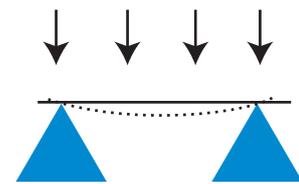

Uniformly Distributed Load in Kgs

Uniformly Distributed Load - In continuous Runs

Uniformly Distributed Load - Simply supported

WARNING!

Do not use a walkway, Ladder or Support for Personnel.

Use only as a Mechanical Support for cables, Tubing and Raceways.

Dimension in Millimeter

Abbreviation : B-Rung Spacing

H-Height

Finish : HDG-Hot Dip Galvanized

PG - Pre Galvanized

Al - Aluminum Alloy - SS34 (SS304 Grade), SS36 (SS316 Grade)

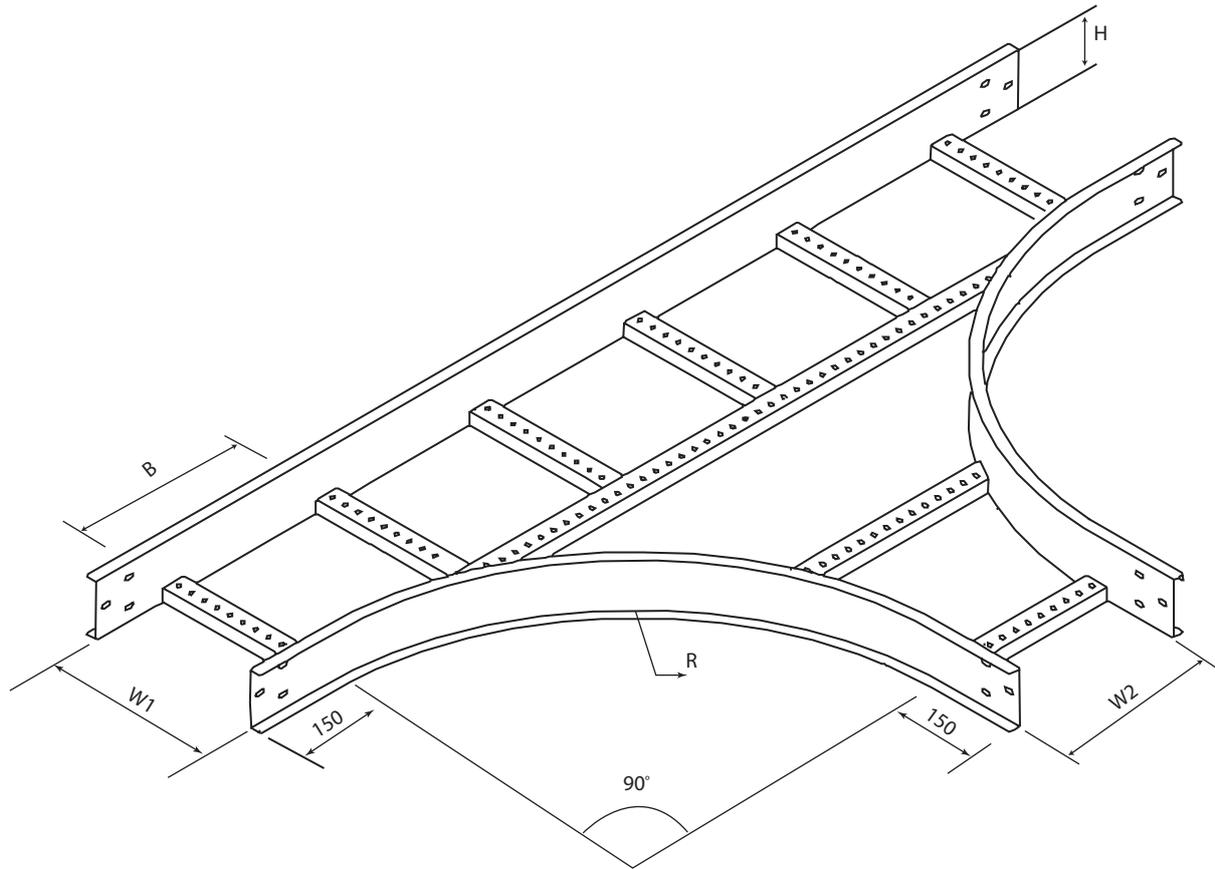

EP - Epoxy Coated

PC - PVC Coated

When ordering please Indicate Material and Finish. We also supply other sizes with the same Rail, Rung profile and various connection slots

Standard Rung - As per the st ladder ordered

Standard Radius - 600mm

45° Vertical External Riser

Model	W	H	Thickness	Radius	Finish
